-!- SUBUNIT: THE VIRUS CAPEID IS COMPOSED OF 60 ICOSAMEDRAL UNITS, EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VP1, VP2, AND VP4.

-!- PTM: SPECIFIC ENZYMATIC CLEAVAGES IN VIVO YIELD MATURE PROTEINS. CLEAVAGE BETWEEN VP4 AND VP2 IS AUTOCATALYTIC; VP1/P2A IS CLEAVAGE BETWEEN VP4 AND VP2 IS AUTOCATALYTIC; VP1/P2A IS CAPALYZED BY P2A; ALL OTHER CLEAVAGES ANE CAPALYZED BY P3C.
-!- SIMILARITY: P2A PROTEASE BELONGS TO PEPTIDASE FAMILY C3.
                                                                                                                                                                                                                       Coxsackievirus B1 (strain Japan).
Viruses; ssRNA positive-strand viruses, no DNA stage; Picornaviridae;
Enterovirus.

Plant Physiol. 115:1359-1369(1997).

-- FUNCTION: INVOLVED IN CYANOGENIS, THE RELEASE OF HCN FROM INJURED TISSUES. CAPALYSES THE STEREOSPECIFIC ADDITION OF HCN TO A VARIETY OF ALDEHYDES IN VITRO. IS A MAJOR SEED CONSTITUENT, AND COULD HAVE THE ADDITIONAL ROLE OF A STORAGE FORM FOR REDUCED NITROGEN.

--- CAPALIZIC ACTIVITY: MANDELONITRILE = CYANIDE + BENZALDEHYDE.
                                                                                                                                                                                                                                                                                                                                                           SUBGULIT: MONOMER.
SUBCELLULAR LOCATION: PRIMARILY FOUND WITHIN PROTEIN BODIES OF THE COTLEDONARY PARENCHYMA CELLS WITH LESSER AMOUNTS WITHIN THE PROCAMBIUM (BY SIMILARITY).
SIMILARITY: BELONGS TO THE GMC OXIDOREDUCTASES FAMILY.

Canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and
                                                                                                                          Enrilchia chaffeenist. Its maino acid sequence was deduced from a partial open reading frame (ORF2) of a genomic locus (see AAV07179) of E. chaffeenist that was obtained on the basis of homology to the major antigenic protein Mapl (see AAW51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical proteins (see AAW51081-95). A claimed composition comprises a nucleic acid (see AAW51091-95). A claimed composition cysee AAW51089-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, haplasma and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies protein a infection (claimed).
               Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAP1) of Ehrlichia sp. The MAP1 gene may be used in a vaccines to protein animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HGWV) enhancer-promoter. Owdria ruminatium genes designated map 2, Ihworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The oplypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynuclectides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    McGuire TC;
consist of proteins shown in AAY06959-970. The proteins and genes are used to detect {\rm E}_{\cdot} chaffeensis in patients and {\rm E}_{\cdot} canis in dogs.
                                                                                                                                      Gaps

This is the full-length variable surface antigen VSA4 protein of Enlichia chaffensis. Its amino acid sequence was deduced from a partial open reading frame (ORF4) of a genomic locus (see AAV07179) of E. chaffeensis that was Obtained on the basis of homology to the major antigenic protein MAP1 (see AAW51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical protein see AAW51091-95). A claimed composition comprises a nucleic acid (see AAW51091-95). A claimed composition (see AAW51089-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Enlichia, Anaplasma and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents the amino acid sequence of variable surface has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures

The sequence represents the amino acid sequence of variable surface has similarity to major antigen broitein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdia man markers in muncleic acid amalysis procedures, and to produce the MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                      New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Outer membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 77; DB 22; Length 280;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence shows a high degree of similarity to the major antiganic protein 1 (MAPI) of Ehrlichia sp. The MAPI gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organism of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HGNV) enhancer-promoter. Cowdria ruminatium genes designated map 2, Ihworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The applyeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynoclectides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                          Barbet AF, Bowle MV, Ganta RR, Burridge MJ, Mahan SM, McGuire TC;

                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                       The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAXV6943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAXV6959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. This is the near full-length variable surface antigen VSA5 protein of Ehrlichia chaffeensis; it lacks about 5-7 C-terminal amino acid residues. The VSA5 amino acid sequence was deduced from a partial open reading frame (ORF5) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAP1 (see AAW51089) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical proteins (see AAW51091-95). A claimed composition comprises a nucleic acid (see AAW07176-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsial, Ehrlichia, madicine, in vaccines to protect against Rickettsial, Ehrlichia, polypeptides can be used diagnostically to detect antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 276;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 73; DB 19;

The sequence represents the amino acid sequence of variable surface antigen 5 (VSA5) isolated from Entlichia chaffeensis, which has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to ricettistal infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in ricketsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                   Major antigenic protein; MAP; vaccine; immunogenic; rickettsia; infection; heartwater; diagnostic; variable surface antigen; VSA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence shows a high degree of similarity to the major antigenic protein 1 (MPL) of Ehrlichia sp. The MAPI gene may be used in a vaccinin 1 (MPL) of Ehrlichia sp. The MAPI gene may be diseases caused by a organism of Rickettsial sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer promoter. Cowdria ruminatium genes designated map 2, ihworf3, Hworf1, Bhworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria runianatium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ehrlichia chaffeensis; MAP1; major antigenic protein 1; antirickettsial; vaccine; gene therapy; Rickettsia; Cowdria; Anaplasma; map2; 1hworf3; 4hworf1; 18hworf1; 3gdorf3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This polypeptide comprises the major antigen protein 1 gene (MAP1) of Ehrlichia chaffeensis. It is encoded by the MAP1 gene (see AAV07177). A claimed composition comprises a nucleic acid (see AAV07176-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, Anaplasma and Cowdia species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence is given in a specification relating to nucleic acid vaccines containing genes to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia Sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The vaccine comprises the major antigenic protein 1 (MAP1) gene or the major antigenic protein 2 (MAP2) gene of rickettsial pathogens. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Cowdria ruminatium genes designated map 2, lhworf3, 4hworf1, 18hworf1 and 3ddorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                         New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                 McGuire TC;

New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures

Disclosure; Column 15-17; 30pp; English.

The sequence represents the amino acid sequence of major antigenic protein 1 (MAPI) from Ehrlichia chaffeensis. The MAP polynucleotides and holypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify or complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_39:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nuclear protein: Hydrolase; Nuclease; Exonuclease.
DOMAIN 264 268 NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).
SEQUENCE 991 AA: 112367 MW; 83FA34D93DADADOO CRC64;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN-972.

STRAIN-972.

MCLEan J., Harris D., Barrell B.G., Rajandream M.A., Walsh S.V.;

MCLEan J., Harris D., Barrell B.G., Rajandream M.A., Walsh S.V.;

Submitted (FEB-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: ESSENTIAL FOR VEGETATIVE CELL GROWTH. CAN BIND TO DNA

AND HAS.5'-3' EXORIBONUCLEASE ACTIVITY.

-!- SUBCELLULAR LOCATION: NUCLEAR (PROBABLE).

-!- SIMILARITY: TO YEAST RATI; SOME, TO YEAST KEMI/DST2 AND S.POMBE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Mol. Biol. 25:875-880(1995).

MEDIATION: ELECTRECALLY SILENY TRANSPORTER SYSTEM WHICH IS A MEDIATOR OF SODIUM AND CHLORIDE REABSORPITON. PLAYS A VITAL ROLE IN THE REGULATION OF IONIC BALANCE AND CELL VOLUME.

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-!- SIMILARITY: BELONGS TO THE SIC12A FAMILY OF TRANSPORTERS.
                                                                                                                       Gaps

hypothetical protein jhp0296 - Helicobacter pylori (strain J99)
C;Species: Helicobacter pylori
A;Variabry: strain J99
C;Date: 12-Feb-1999 #sequence_revision 12-Feb-1999 #text_change 08-Oct-1999
C;Accession: A71950
B;Alm, R.A.; Ling, L.S.L.; Moir, D.T.; King, B.L.; Brown, E.D.; Doig, P.C.; Smith, D. F; Ives, C.; Gibson, R.; Merberg, D.; Mills, S.D.; Jiang, Q.; Taylor, D.E.; Vovis, G.F Nature 397, 176-180, 1999
A;Title: Genomic sequence comparison of two unrelated isolates of the human gastric paracterace number: A71800; MUD:99120557
A;Accession: A71950
A;Status: preliminary
A;Molecule type: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C;Species: Pyrococcus horikoshii
C;Date: 14-Aug-1998 #sequence_revision 14-Aug-1998 #text_change 05-Nov-1999
C;Accession: G71133
